SECRET/SECURITY INFORMATION

25X1

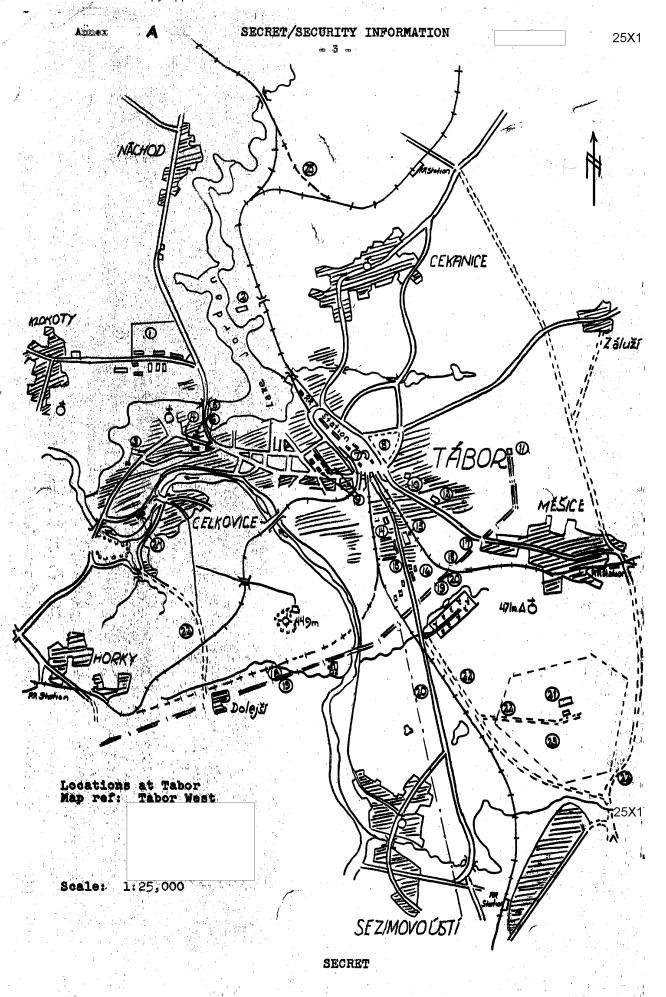

-2-

then processed by a 100-ton press. The factory had no such press at its disposal in the summer of 1952, although it had been ordered. Until the delivery of this press, semi-finished patterns were sent away for pressing, probably to the Armament Works (Zbrojovka).

- 5. The same material was used by the factory for production of various prototypes for military purposes, such as a lid with impressed threading, 75 mm. in diameter and casings of mines to be used in laying out mine fields.

 The pressed products (vylisky) were precision-made, very hard but by no means brittle, and had a smooth surface. Prototypes for military purposes were classified as secret, and employees handling them were bound to strict silence by oath.
- 6. In April 1952 the Silon Plant, National Enterprise, at Plana nad Luznici /4921N-1442E/ requested the paper goods factory at Tabor to produce prototypes of conical bobbins for spooling of silon yarn. They were to be made out of a material particularly resistant to pressure, because silon has a high contraction coefficient. Standard bobbins as delivered by the Lanskroun Paper Mills, National Enterprise (Lanskrounske papirny, n.p.) at Lanskroun /4955N-1637E/ proved not to be adequate because of too little resistance to crushing. It was therefore decided to make bobbins out of the Tabor factory's pressure-resistant cellulose material.
- 7. Other objects of research were paper caps for milk bottles and paper milk containers. It was desired to use these in order to save metal and cork.
- 8. Besides research activities, the Tabor plant was engaged in mass production of small paper goods.
